General Sprinkler Characteristics	The following are characteristics of a sprinkler that define its ability to control or extinguish a fire. (1) Thermal sensitivity. A measure of the rapidity with which the thermal element operates as installed in a specific sprinkler or sprinkler assembly. One measure of thermal sensitivity is the response time index (RTI) as measured under standardized test conditions. (a) Sprinklers defined as fast response have a thermal element with an RTI of 50 (meters-seconds) 1/2 or less. (b) Sprinklers defined as standard response have a thermal element with an RTI of 80 (meters-seconds) 1/2 or more. (2) Temperature rating. (3) K-factor (see Chapter 7). (4) Installation orientation (see 3.3.205.3). (5) Water distribution characteristics (i.e., application rate, wall wetting). (6) Special service conditions.	13 (2019)	13 (2019)	13 (2019)

Ground Leakage Current	Current that is introduced into the grounding conductor by normal equipment operation, such as capacitive coupling. Many RFI/EMI filters in electronic equipment have capacitors from current-carrying conductors to the equipment-grounding conductor to shunt noise emitted from or injected into their power supplies. Even with listed equipment, the sum of the current from a large quantity of such equipment in a facility can result in significant ground currents.	70B (2019)	70B (2019)	70B (2019)

Performance-Based Approach	An approach that relies upon measurable (or calculable) outcomes (i.e., performance results) to be met but provides more flexibility as to the means of meeting those outcomes. A performance-based approach is one that establishes performance and results as the primary basis for decision-making and incorporates the following attributes: (1) Measurable or calculable parameters exist to monitor the system, including facility performance; (2) objective criteria to assess performance are established based on risk insights, deterministic analyses, and/or performance history; (3) plant operators have the flexibility to determine how to meet established performance criteria in ways that will encourage and reward improved outcomes; and (4) a framework exists in which the failure to meet a performance criterion, while undesirable, will not in and of itself constitute or result in an immediate safety concern.	805 (2020)	805 (2020), 806 (2020)	805 (2020), 806 (2020)

Photoelectric Light Obscuration Smoke Detection	The principle of using a light source and a photosensitive sensor onto which the principal portion of the source emissions is focused. When smoke particles enter the light path, some of the light is scattered and some is absorbed, thereby reducing the light reaching the receiving sensor. The light reduction signal is processed and used to convey an alarm condition when it meets preset criteria. (SIG-IDS)	72 (2019)	72 (2019)	72 (2019)

Photoelectric Light-Scattering Smoke Detection	The principle of using a light source and a photosensitive sensor arranged so that the rays from the light source do not normally fall onto the photosensitive sensor.
